MOBILIZED STORAGE SYSTEM

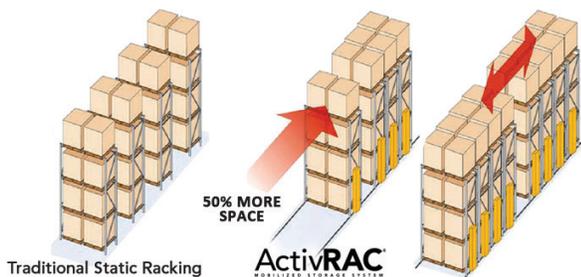

## MAXIMIZE FREEZER & COOLER STORAGE SPACE

Cold storage is expensive storage, and we can help optimize every cubic foot. Mount new or existing pallet racking on a carriage-and-rail system that's custom designed to fit your cooler or freezer.

ActivRAC's innovative storage system accommodates existing storage for multiple SKUs and provides a compact solution to recover wasted cooler space. One moving aisle replaces multiple aisles required by static racking, creating up to 50% more storage while still providing 100 percent access and selectivity at all times.

### FEATURES & BENEFITS

- Cost savings: designed to work with existing pallet racking and industrial shelving
- Time savings: Open aisles from a distance of up to 100 feet with the TUSC™ Control app
- Available in steel or stainless steel construction to provide increased corrosion resistance in atmospheric and pure water environments, improved corrosion resistance to most acids, alkaline solutions, and chlorine-bearing environments
- Hygiene: stainless steel is the first choice for strict hygiene conditions in hospitals, pharmaceutical manufacturing facilities, clean rooms, kitchens, abattoirs and other clean facilities.
- Free up space and maximize storage within the same storage footprint
- Reduce the need for plant expansions, or leasing/purchasing of additional facilities
- Ease of installation: installs on existing unlevelled concrete

**Ideal for any climate-controlled storage application, including food warehouses, composite manufacturers, pharmaceutical manufacturers, and beverage distributorships.**

**ACCESSIBILITY**  
Open aisles by pressing the touchpad or using the TUSC™ Control app.

**SYSTEM FLEXIBILITY**  
Systems tailored for walk-in coolers, cold rooms, refrigeration systems and refrigerated warehouses.

With **ActivRAC Mobilized Storage**, otherwise stationary (or fixed) rows of pallet racking are mounted on carriages and mobilized. The carriages, which can also be equipped with shelving and cabinets, travel on wheels mated to a rail system. By moving side to side, the system is able to “compress” (or compact) the stored materials into a much smaller footprint when compared with a stationary system – yet provide 100 percent access whenever needed. Each system can be configured to match the dimensions of stored materials or given footprint.
